Machine Learning Implementation and Evaluation

Evaluation of machine-learned systems is a multifaceted process that encompasses internal validation, clinical validation, clinical outcomes evaluation, implementation research and postimplementation evaluation.

Implementation research includes qualitative and quantitative components and formative assessments and is attentive to the context in which the system is being deployed while evaluation frameworks can help teams structure their studies and analyses.

Business Recommendation

It is difficult to measure how good a recommendation engine is for a business problem. Binary or rank-aware accuracy-related metrics will be a great starting point to generate a set of candidate items via the selected ML method. Unfortunately, accuracy doesn't go hand in hand with metrics such as diversity or novelty that are essential for customer satisfaction.
